Electric Fields - Physics

The electric field is the amount of electric force per charge and the electric force on a charge at some point in space is the amount of charge times the electric field at that point in space. So recapping, electric charges create electric fields.

Electric field definition (video) | Khan Academy

A charged object is the source of an electric field that permeates the space around it. This field is how one charge exerts a force on another over a distance.

Electric field is defined as the electric force per unit charge. The direction of the field is taken to be the direction of the force it would exert on a positive test charge. The electric field is radially outward from a positive charge and radially inward toward a negative point charge. Click on any of the examples above for more detail.

Experimental evidence has led to the Electric Charge Model. • Friction between objects can cause charge to be added or lost • Charge has two kinds - Positive and Negative • Charges exert force - like charges repel - opposite attract • The force acts over a distance (non-contact) • Neutral objects have an equal mixture of +ve and -ve charges.
