NoSQL databases are databases designed to be used across large distrusted systems. They are notably much more scalable and much faster at handling very large data loads than traditional relational databases. Unlike other databases, NoSQL databases do not use the standard tabular relationships the relational databases employ.

NoSQL databases aren't restricted to a rows-and-columns approach. They are designed to handle a great variety of data, including data whose structure changes over time and whose interrelationships aren't yet known. NoSQL databases come in four core types — one for each type of data the database is expected to manage:

Managing Different Data Types with NoSQL - dummies

In the case of NoSQL databases, this selection is much more complex, since it depends not only on the factors above but also in what type of database is better suited for our application. This is because there are four types of NoSQL databases nowadays: key-value, column-based, document-based, and graph-based, each with its peculiarities, pros and cons, which will be detailed in this article.
